Subject: gen 15

Hi Gavan we have finally got the gen 15 hydrogen system set up and running it still needs a bit of tweaking but so far i am very happy with the results i have a 2004 ford RTV 4.0 litre tray ute i do about 38 – 40,000 ks a year. on unleaded i was using approx. 11-12 litres per 100 ks it varied depending on the weight i was carrying some times up to a ton depending on how long we were going bush for. The weekend just gone 28-30 oct 2016 we went camping with about 300 kgs of camping gear and sitting on the speed limit using the cruise control round trip 459 ks in total i topped the fuel back up when we got back and it only took 54 lt = 8.5 litres per 100 ks. if you require any further info please feel free to get in touch.

kind regards
Kevin brooks

p.s. i don't go by the trip meter in cars i fill the tank to the top then a pone return i fill it to the top again litres per kilometre i believe is the best way.
