Hi Gavan

Sorry to take so long. The results for the harvester for the first 2 hours of operation was that the power increase was very noticeable. Almost as good as putting a turbocharger on a naturally aspirated engine and the fuel usage for the period was approx. one third less.

When we finally get some decent rain and the dams fill, I will be running the unit on the diesel pump and will obtain some accurate fuel usage figures which I shall pass on.

Till then,

With regards

P Vella
